

RTP GLOBAL · CASE STUDY · CONVICTION

Kush Agarwal | [Deployed Link](#) | [Github Link](#)

THE PROBLEM

A founder call generates valuable context that rarely makes it into a CRM - why a market felt **attractive**, what **concerns** came up, what **follow-up** was promised, and why a **deal** was **passed** or **progressed**.

In a **lean** VC team, that **context** gets scattered across notes, emails and memory. A few weeks later, much of the **reasoning** behind a decision is **lost**.

WHAT I BUILT

Conviction is a deal intelligence workspace that combines company research, post-call intelligence and deal memory.

- Add a **company website** to generate a startup brief, thesis-fit analysis and diligence questions.
- Record a **voice note**, upload a **meeting recording** or type a **post-call brain dump**.
- Generate structured **deal notes**, **strengths**, **concerns**, **follow-up actions** and draft **founder emails**.
- **Store** investment **reasoning** and surface it when a company is **revisited** later.

The goal was not to **automate investing**. The goal was to reduce the **operational work** around **research**, **note-taking** and **follow-ups** while preserving **investment context**.

TOOLS & MODELS

- **Gemini 2.5 Flash-Lite** for deal intelligence generation.
- **Whisper Large V3 Turbo** for voice transcription.
- **Gemini with Search Grounding** for company research.
- **Tavily** for web search.
- **Jina Reader** for website extraction.

Fallback paths were added to handle model failures and rate limits gracefully.

WHAT DIDN'T WORK

- **Free-tier** limits restricted access to stronger models such as **Claude** during development.
- **Founder research** was limited by LinkedIn, Crunchbase and other paid or restricted data sources.
- **Early outputs** looked polished but lacked useful **investment insight**, requiring several iterations on **prompts** and **structure**.

WHAT I'D EXTEND

- Route **different tasks** to the **model best suited** for them.
- **Personalise outputs** using a fund's actual investment thesis and historical decisions.
- Integrate richer founder and company **data sources**.
- Add **pattern detection** across deals and portfolio companies.

The goal was not to build something **flashy**. It was to solve **small, recurring problems** that happen around every deal and give investors more time to focus on judgment rather than administration.
